	Urgent	**Not Urgent**
Important	**Do - (Your MVP)** 1. Access laptop webcam and display live video 2. Detect objects in real time using a pretrained model 3. Draw bounding boxes and labels around detected objects	**Schedule - (For V2.0+)** 1. Track individual objects as they move 2. Estimate the distance of objects from the camera 3. Add warnings when obstacles are detected
Not Important	**Delegate - (Use a library)** 1. Use OpenCV to capture webcam footage 2. Use Google MediaPipe for pretrained object detection 3. Use OpenCV to draw rectangles and text	**Delete - (Cut it)** 1. Train my own object detection model 2. Build a custom graphical user interface 3. Integrate the program with a physical robot
